Strategies for Producing ANTIBIOTIC-FREE POULTRY

WATER QUALITY

Amlan INTERNATIONAL

1 REGULARLY TEST AND MONITOR WATER QUALITY

- Experts recommend testing water at least annually.
- Examine samples for microbial contamination, as well as mineral content.

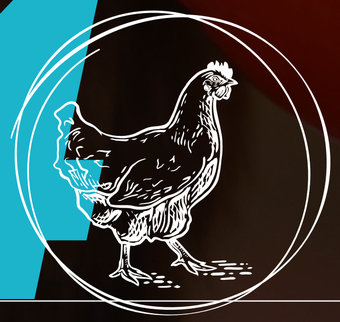
2 BE ON GUARD AGAINST MICROBIAL CONTAMINATION

- Pathogens tend to thrive in poultry house water lines.
- Contamination may cause biofilm, which is both a health issue and a potential equipment risk.

3 CLEAN AND FLUSH WATER LINES CONSISTENTLY

- Regularly cleaning and flushing lines removes biofilm and other buildup.
- Water storage tanks also need cleaning to prevent mold or other contaminants.

4 BOOST POULTRY'S IMMUNE RESPONSES WITH AGP ALTERNATIVES



- Stronger immune responses mean less susceptibility to disease.
- Natural alternatives to AGPs can help poultry fight bacteria and stay healthier.
